Report Overview

Dragging Equipment Detector (DED) Technology is deployed to actively detect and alert users to objects dragging from passing trains. A variety of objects are typically secured at or near the underside of a train and may become loose or partially detached from the train in some situations. For example, the vibration of the train travelling along the track may cause an air hose, a pipe or other object to drag beneath the train. This dragging equipment can damage the rail infrastructure and present a hazard to infrastructure equipment, e.g. points, sleepers, crossings and in extreme cases, result in derailment. To make matters worse, train drivers would likely be unaware that the train is causing extensive damage as it moves along.
