Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on DRAM-less SSD Main Controller Chip competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. A DRAM-less SSD controller chip is a chip used in solid-state drives (SSDs) to control NAND storage, perform error correction, manage read/write and garbage collection, and communicate with the host. However, it does not integrate additional DRAM cache and instead relies on host memory (via HMB technology) or internal SRAM for metadata processing. Shipments of these DRAM-less SSD controller chips are expected to reach approximately 200 million units in 2024, with an average unit price of approximately \$6. A single high-end controller production line has an annual production capacity of approximately 20 million units. Upstream suppliers include semiconductor wafer fabrication plants, logic process technology, IP cores (LDPC, ECC, encryption), SRAM design companies, and packaging and testing firms. Downstream suppliers include SSD manufacturers, storage system integrators, laptop/desktop manufacturers, and server storage subsystem vendors. For example, if an SSD uses one DRAM-less controller, it "consumes" one chip, and all SSD shipments represent consumption by the controller chip manufacturer. In a good market environment, DRAM-less controller manufacturers may achieve a gross profit margin of 25% to 35%, but it may drop to 10% to 15% during periods of fierce competition or rising costs.

The global DRAM-less SSD Main Controller Chip market size was estimated at USD 1200.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.40% during the forecast period.
