Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on DRAM Less SSD competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. DRAM-less SSDs (or DRAM-less SSDs) lack a dedicated DRAM cache. Instead, the main controller chip uses host memory (e.g., HMB technology) or internal SRAM to store metadata to manage NAND learning mapping tables, garbage collection, and error correction. Shipments of these SSDs are expected to reach approximately 32 million units in 2024, with an average unit price of approximately \$65. A single efficient production line could produce between 800,000 and 1.2 million units annually. The upstream market includes NAND flash chip manufacturers, semiconductor foundries, logic design houses, IP core providers, packaging and testing houses, controller design companies, and in-house SRAM designers. The downstream market includes SSD brand manufacturers, laptop/desktop OEMs, and server storage subsystem integrators. For example, if an SSD uses a DRAM-less controller, then that SSD "consumes" one controller; the total number of downstream SSDs shipped represents the controller manufacturer's consumption. In terms of gross profit margin, DRAM-less controller chip manufacturers can achieve a gross profit margin of 20% to 30% when demand is strong and the technical threshold is high. However, if market competition is fierce or costs rise, the gross profit margin may be compressed to 10% to 15%.

The global DRAM Less SSD market size was estimated at USD 2080.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.40% during the forecast period.
