Report Overview

DRIE deep silicon etching equipment, full name Deep Reactive Ion Etching (deep reactive ion etching) equipment, is a key equipment used in the microelectronic dry etching process for manufacturing microelectronic chips. DRIE equipment is based on high aspect ratio silicon etching technology of fluorine-based gases. Similar to the principle of reactive ion etching (RIE), it uses the anisotropy of silicon to etch through chemical and physical effects. Specifically, the process separates the generation of plasma and the generation of self-bias through two RF sources, effectively avoiding the contradiction between RF power and plasma density in RIE etching.

The global DRIE Deep Silicon Etching Equipment market size was estimated at USD 148 million in 2023 and is projected to reach USD 329.49 million by 2032, exhibiting a CAGR of 9.30% during the forecast period.

North America DRIE Deep Silicon Etching Equipment market size was estimated at USD 44.96 million in 2023, at a CAGR of 7.97% during the forecast period of 2024 through 2032.
