Abstracts

DRIE deep silicon etching equipment, full name Deep Reactive Ion Etching (deep reactive ion etching) equipment, is a key equipment used in the microelectronic dry etching process for manufacturing microelectronic chips. DRIE equipment is based on high aspect ratio silicon etching technology of fluorine-based gases. Similar to the principle of reactive ion etching (RIE), it uses the anisotropy of silicon to etch through chemical and physical effects. Specifically, the process separates the generation of plasma and the generation of self-bias through two RF sources, effectively avoiding the contradiction between RF power and plasma density in RIE etching. The rapid development of the domestic integrated circuit industry has led to a continued increase in demand for deep silicon etching equipment. This is mainly due to the widespread application of microelectronic dry etching processes (including DRIE) in integrated circuit manufacturing. In addition, with the expansion of the market scale, the competition in the DRIE deep silicon etching equipment market has become increasingly fierce. The DRIE deep silicon etching equipment market is currently in a steady growth stage, and the future market potential is huge. With the continuous advancement of technology and the accelerated promotion of localization, the market will present a more intense competition.
