## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Dried Seaweed competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Dried Seaweed refers to dehydrated marine algae such as nori, kelp, wakame and kombu, widely used in snacks, soups, condiments, food ingredients, nutraceuticals and cosmetic formulations. In 2024, the global average price of dried seaweed is approximately US\$3.6 per kilogram, with global dry-weight production reaching around 1.95 million tons. Gross margins generally range from 18%?35%, influenced by cultivation cost, coastal farming density, drying technology, processing grade and export logistics. The supply chain includes upstream seaweed farming, biomass harvesting and primary drying; midstream processors handle roasting, cutting, milling, sterilization and packaging; downstream customers include snack producers, food processors, restaurants, nutraceutical manufacturers, personal care brands and wholesale distributors. Demand for dried seaweed is rising due to the shift toward healthy snacking, plant-based nutrition and natural umami ingredients. Growth is supported by expanded aquaculture capacity, improved low-temperature drying techniques and the adoption of seaweed extracts in nutraceutical and cosmetic applications. Sustainability and carbon-negative characteristics enhance the long-term value of seaweed, positioning it as a core ingredient in future functional and clean-label food products.

The global Dried Seaweed market size was estimated at USD 7026.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.60% during the forecast period.
