## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Drilling Fluid Shale Shaker? competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Drilling Fluid Shale Shaker? is a primary solid control equipment in the drilling fluid solid control system. It is mainly used to separate large solid particles (usually larger than 74  $\mu$ m) from the drilling fluid. Its working principle is to drive the screen to move through the vibration motor, so that when the drilling fluid flows through the screen, the larger solid particles are retained and discharged by the screen, while the finer drilling fluid and small solid particles pass through the screen and continue to circulate. It is usually installed above the drilling fluid tank and is the first process of drilling fluid treatment. It can effectively reduce the solid content in the drilling fluid and play a protective and auxiliary role for subsequent solid control equipment (such as centrifuges, etc.).

The global Drilling Fluid Shale Shaker? market size was estimated at USD 482.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.30% during the forecast period.
