Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Drilling Thinner competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global Drilling Thinner production reached approximately 315.8 K MT, with an average global market price of around US\$ 1561 per MT. Drilling thinner is a chemical additive widely used in the oil and gas industry during the preparation and circulation of drilling fluids. Its primary role is to reduce the viscosity of drilling muds, particularly those that have become too thick due to contaminants, high solids content, or reactions with formation clays. By dispersing colloidal particles and preventing flocculation, drilling thinners ensure that the fluid retains favorable rheological properties. This allows for effective suspension and transport of drill cuttings, minimizes excessive pump pressure, and reduces the risk of stuck pipe or drilling delays. Typical types of drilling thinners include lignosulfonates, tannins, and other organic polymers, which are selected based on reservoir conditions and the compatibility with other drilling fluid components. As such, the drilling thinner market is closely tied to both the global energy industry and the development of advanced drilling technologies.

The global Drilling Thinner market size was estimated at USD 493.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.00% during the forecast period.
