Abstracts

The dripping bipolar electrocoagulation forceps is a medical device that combines bipolar electrocoagulation technology and drip cooling function. It transmits high-frequency current to the tissue through the bipolar electrode, causing a local thermal effect on the tissue, thereby achieving the purpose of hemostasis. At the same time, during the electrocoagulation process, sterile saline is continuously dripped to the tip of the forceps through the dripping device to reduce the temperature of the tip of the forceps, reduce thermal damage, and prevent eschar from adhering to the tip of the forceps. The dripping bipolar electrocoagulation forceps are widely used in various surgical operations, especially in neurosurgery, ophthalmology, otolaryngology, plastic surgery and other fields that require delicate operations. It can effectively control bleeding, reduce surgical trauma, and improve the success rate of surgery.
