Abstracts

A driver assistance camera is an optical sensor system integrated into vehicles to capture real-time visual data of the vehicle's surroundings, primarily the road ahead, and process this information using computer vision algorithms to support or automate specific driving functions. These cameras serve as critical components in Advanced Driver Assistance Systems (ADAS), enabling features such as lane departure warning, traffic sign recognition, forward collision warning, automatic emergency braking, pedestrian detection, and adaptive cruise control. Unlike traditional dashcams, which passively record footage, driver assistance cameras are active safety systems that analyze the environment and interact with other vehicle systems, such as braking or steering controls, to enhance driver awareness, prevent accidents, and support semi-autonomous driving capabilities.

The global Driver Assistance Camera market size was estimated at USD 12000.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 12.50% during the forecast period.
