## Abstracts

A ride-on roller is a heavy-duty machine used in the construction of infrastructure such as roads, bridges, and airports. The operator directly controls the compaction process through the driver's seat. It compacts various ground materials such as soil, asphalt, and gravel through the weight or vibration of the equipment itself, ensuring the density and stability of the construction area. Ride-on rollers are a key compaction equipment, widely used in infrastructure construction such as roads, airports, bridges, and dams, and are controlled by drivers to compact ground materials. The global ride-on roller market is showing a steady growth trend with the acceleration of infrastructure construction and the advancement of urbanization. The global total market size will reach approximately US\$2.6 billion in 2023, and the market share will be dominated by several global leading companies, including Wirtgen Group, Caterpillar, XCMG, Sany Heavy Industry, etc. In terms of regions, China, the United States, and Europe occupy the main market share. Ride-on rollers can be divided into vibratory rollers and static rollers according to their compaction methods and operating characteristics. Their application areas cover road construction, airport runways, bridges, and urban infrastructure compaction. From the perspective of classification, vibratory rollers are the main products in the market. Through mechanical vibration and the weight of the equipment, they are suitable for deep compaction projects, especially for scenes requiring high density, such as highways and large industrial projects; while static rollers mainly rely on their own weight and are suitable for more delicate construction projects such as asphalt compaction, road maintenance, and bridges that require high road surface flatness. In terms of technology trends, intelligence and environmental protection are the key points of future development. Intelligent control systems, automatic driving and remote monitoring functions are gradually being applied to ride-on rollers to improve construction efficiency and reduce human operating errors. At the same time, with the strengthening of environmental protection regulations, low-emission

and high-fuel-efficiency ride-on rollers have attracted much attention, and equipment using new energy power and energy-saving technologies is developing rapidly, helping to reduce the impact on the environment during construction.

The global Driving Road Roller market size was estimated at USD 2824.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.50% during the forecast period.
