Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on DrMOS Wireless Charging Full-Bridge Power IC competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. The DrMOS wireless charging full-bridge power chip integrates the driver and MOSFET power switch in one module, which is used to convert DC into high-frequency AC to drive the coil at the wireless charging transmitter (usually using a full-bridge topology to achieve high power and high efficiency). The global estimated shipment volume in 2024 is about 300 million units, and the average unit price in 2024 is about US\$1.8 per unit. The annual production capacity of a single line can reach about 50 million to 80 million units. Upstream manufacturers are concentrated in silicon/power semiconductor wafer manufacturing, drive circuit design, MOSFET devices, packaging and testing, and power management IP core companies. The main downstream application manufacturers are mobile phone manufacturers, wireless charging board manufacturers, wearable device manufacturers, automotive wireless charging module manufacturers, smart home device manufacturers, etc. For example, the downstream consumption is that each mobile phone that supports wireless charging uses one DrMOS wireless charging full-bridge power chip, each wireless charging board may use 2-4 chips, and each car equipped with on-board wireless charging may be equipped with 4-6 chips (or more) as the transmission power level. The gross profit margin is estimated to be Between 35% and 45%.

The global DrMOS Wireless Charging Full-Bridge Power IC market size was estimated at USD 540.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.30% during the forecast period.
