Report Overview

Dronabinol (CAS 1972-08-3) is a synthetic form of delta-9-tetrahydrocannabinol (THC), the primary psychoactive compound found in cannabis, used primarily for medical purposes such as treating chemotherapy-induced nausea and vomiting, as well as stimulating appetite in AIDS-related anorexia. The market for dronabinol is driven by increasing legalization of medical cannabis, growing acceptance of cannabinoid-based therapies, and rising demand for effective treatments in oncology and chronic disease management. Regulatory approvals in key markets, such as the U.S. FDA's sanctioning of Marinol (a dronabinol-based drug), have further strengthened its commercial viability. However, competition from alternative cannabinoid-based treatments, concerns over psychoactive side effects, and stringent regulatory frameworks in some regions pose challenges. The market is segmented into pharmaceuticals, research applications, and compounding pharmacies, with North America leading due to favorable legislation and high healthcare expenditure, while Europe and Asia-Pacific show gradual adoption. Emerging trends include the development of improved formulations with reduced side effects and expansion into new therapeutic areas like chronic pain and neurological disorders.

The global Dronabinol (CAS 1972-08-3) market size was estimated at USD 175.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
