Report Overview:

Dronabinol is a form of delta-9-tetrahydrocannabinol (THC), the primary psychoactive component of cannabis (marijuana). THC demonstrates its effects through weak partial agonist activity at Cannabinoid-1 (CB1R) and Cannabinoid-2 (CB2R) receptors, which results in the well-known effects of smoking cannabis such as increased appetite, reduced pain, and changes in emotional and cognitive processes. Due to its evidence as an appetite stimulant and an anti-nauseant, Dronabinol is approved for use in anorexia associated with weight loss in patients with AIDS and for the treatment of nausea and vomiting associated with cancer chemotherapy in patients who have failed to respond adequately to conventional antiemetic treatments.

The Global Dronabinol Market Size was estimated at USD 258.17 million in 2023 and is projected to reach USD 374.58 million by 2029, exhibiting a CAGR of 6.40% during the forecast period.
