Report Overview:

Drone Inertial Navigation Systems (INS) are a type of navigation technology commonly used in unmanned aerial vehicles (UAVs) or drones. INS is designed to determine the position, orientation, and velocity of the drone without relying on external references like GPS (Global Positioning System).

An INS operates based on the principles of inertial navigation, which leverages the laws of physics to estimate the drone's movement. It utilizes accelerometers and gyroscopes to measure the drone's acceleration and angular rate, respectively. By integrating these measurements over time, the system can calculate the drone's velocity and position relative to its starting point.

The Global Drone Inertial Navigation Systems Market Size was estimated at USD 253.58 million in 2023 and is projected to reach USD 640.54 million by 2029, exhibiting a CAGR of 16.70% during the forecast period.
