Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Drone Propulsion Motor competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global Drone Propulsion Motor production reached approximately 53.67 million units, with an average global market price of around US\$ 20.01 per unit. A drone propulsion motor is a crucial component that drives the mechanical propulsion system of unmanned aerial vehicles (UAVs), providing the necessary thrust to enable flight. These motors are usually electric and can be classified as brushless or brushed motors, with brushless motors being the most common due to their higher efficiency and longer lifespan. The propulsion motor consists of a rotor and stator, and it operates by converting electrical energy from the battery into mechanical energy to drive the drone's propellers. The key raw materials involved in the manufacturing of drone propulsion motors include copper for windings, rare-earth magnets for the rotor, and high-quality steel for the motor housing and shaft. The motor is powered by lithium-ion or lithium-polymer batteries. Downstream, these motors are integral to various drone applications such as aerial photography, surveying, inspection, agriculture, and search and rescue missions. The industry gross margin for drone propulsion motors generally ranges between 40% and 60%, depending on the performance, material quality, and manufacturing precision. The production line for these motors involves precision assembly, winding, and rigorous testing to ensure the motor's efficiency, durability, and reliability.

The global Drone Propulsion Motor market size was estimated at USD 1074.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 16.70% during the forecast period.
