Report Overview

Drug Eluting Stents (DES) are medical devices used in the treatment of coronary artery disease. These stents are designed to prevent restenosis, which is the re-narrowing of the arteries after a stent has been inserted. DES are coated with medication that is slowly released into the surrounding tissue, helping to reduce inflammation and inhibit cell proliferation. This innovative technology has significantly improved the outcomes of patients undergoing coronary artery stenting procedures by reducing the need for repeat interventions.
