Abstracts

Drug-release sutures are smart medical materials that combine suturing functions with drug release mechanisms and are made of degradable biomaterials. They can slowly release drugs (such as antibiotics, anti-inflammatory drugs, analgesics or growth factors, etc.) while suturing wounds to promote wound healing, reduce infection, control inflammation or relieve postoperative pain. The drug release rate can be regulated according to the different stages of the wound healing process, so that patients can receive continuous treatment after surgery, avoiding repeated medication and the side effects of traditional drug treatments.

The global Drug-Release Sutures market size was estimated at USD 609.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 10.30% during the forecast period.
