Abstracts

Drug Taste Masking Technologies refer to a range of pharmaceutical formulation techniques designed to improve palatability by minimizing the bitterness or metallic taste of active pharmaceutical ingredients (APIs). These technologies employ various mechanisms such as coating, complexation, ion exchange, microencapsulation, or the use of taste blockers to prevent direct interaction between the drug and taste receptors. They are extensively applied in oral solid and liquid formulations, including chewable tablets, orally disintegrating tablets (ODTs), syrups, and suspensions, with significant demand in pediatric, geriatric, and chronic disease medications. As patient-centric drug design becomes increasingly emphasized, taste masking has evolved from a formulation accessory into a critical competitive differentiator within modern pharmaceutical innovation.

The global Drug Taste Masking Technologies market size was estimated at USD 1124.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.60% during the forecast period.
