## Abstracts

Drum Pulping System is a mechanical method used in the paper recycling industry to separate fibers from waste paper or other fibrous materials. The system uses a rotating drum with internal blades or paddles to agitate and break down the paper into pulp by applying water and mechanical force. This process effectively loosens the fibers while removing contaminants, such as ink, staples, or adhesives, to prepare the material for further processing into new paper products. Drum pulping is known for being efficient, low-energy, and effective in handling large volumes of material.

The global Drum Pulping System market size was estimated at USD 436.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.40% during the forecast period.
