## Abstracts

Dry aluminium fluoride ( $\text{AlF}_3$ ) is an inorganic compound primarily used as a flux in the production of primary aluminium through the Hall-Heroult electrolytic process. It serves to lower the melting point of alumina (aluminium oxide), reduce energy consumption, and improve the overall efficiency and conductivity of the electrolytic bath. Its dry form, characterized by low moisture content, is critical to prevent operational issues such as hydrogen fluoride emissions and bath instability in smelters. The compound is typically manufactured via the reaction of alumina with hydrogen fluoride gas or through the thermal decomposition of ammonium hexafluoroaluminate, with strict quality controls to ensure low levels of impurities like silica, iron, and moisture, which can adversely affect aluminium purity and smelter performance.

The global Dry Aluminium Fluoride market size was estimated at USD 520.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
