Abstracts

A dry anaerobic digestion system is a waste-to-energy technology that processes solid or semi-solid organic materials?such as agricultural residues, yard waste, or source-separated municipal organics?without adding large amounts of water. In an oxygen-free (anaerobic) environment, microorganisms break down the organic matter, producing biogas (mainly methane and carbon dioxide) that can be used for heat, electricity, or renewable natural gas, along with a stabilized digestate that can serve as compost or soil amendment. Compared to wet systems, dry anaerobic digestion handles higher solids content (typically 20?40%), reduces the need for dilution and wastewater treatment, and is well suited for fibrous biomass and space-limited installations.

The global Dry Anaerobic Digestion System market size was estimated at USD 725.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.80% during the forecast period.
