Abstracts

Dry biochemistry analyzers are automated clinical laboratory instruments designed to perform quantitative analysis of various biochemical parameters in biological samples, primarily blood serum or plasma, using dry reagent slide technology. These systems operate by applying a small sample volume onto a multi-layered solid-phase reagent slide, where chemical reactions occur in dedicated layers for specific analytes such as glucose, cholesterol, liver enzymes, renal function markers, and electrolytes, with results measured through reflectance photometry. The technology eliminates liquid reagents, reducing preparation time, minimizing waste, and enhancing operational efficiency, making these analyzers particularly suitable for decentralized testing settings like physician offices, small clinics, and emergency departments, where rapid turnaround, ease of use, and compact footprint are prioritized over high-throughput capabilities.

The global Dry Biochemistry Analyzer market size was estimated at USD 2350.42 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.65% during the forecast period.
