Abstracts

Dry Block Calibrator, also known as dry block furnace or dry well furnace, is a portable temperature calibration device that provides a stable temperature field without the need for a liquid medium based on solid state temperature equalizing block technology. The core principle is to quickly generate a uniform and controllable temperature environment (-100 °C to 1200 °C) by heating or cooling the internal high thermal conductivity alloy temperature block (such as copper or aluminum), which is used to calibrate temperature sensors such as thermocouples and thermal resistors.

The global Dry Block Calibrator market size was estimated at USD 579.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.60% during the forecast period.
