### Report Overview:

The dry claw vacuum pump uses positive displacement by trapping the gas and moving it through the pump which creates pressure. A claw vacuum pump is approximately 30% more efficient than a comparable rotary vane pump and the claw pump uses less energy. Because the claw pump runs dry and doesn't use any oil, it can run hot. However, this can be viewed as an advantage because it helps reduce condensation of pumped vapors and contamination. Because of the higher operating temperature, the dry claw vacuum pump can typically accept higher temperature gases that would normally condense at lower operating temperatures. For that same reason, the dry claw pump also has positive water vapor pumping characteristics as well. It's important to keep in mind that the higher operating temperatures could potentially require the pump bearings and seals to be purged in order to prevent heat related failure.

The Global Dry Claw Vacuum Pumps Market Size was estimated at USD 303.30 million in 2023 and is projected to reach USD 406.45 million by 2029, exhibiting a CAGR of 5.00% during the forecast period.
