Abstracts

Dry Desulfurization System refers to a set of air pollution control technologies designed to remove sulfur dioxide (SO₂) from flue gases generated by industrial processes, primarily from coal-fired power plants, waste incineration facilities, and certain metallurgical operations, without the use of liquid scrubbing agents; instead, these systems utilize dry sorbents—most commonly lime or limestone—which are injected into the flue gas stream where a chemical reaction occurs, producing a dry solid byproduct (such as calcium sulfite or sulfate) that can be collected and disposed of or repurposed, offering advantages such as reduced water consumption, simpler waste handling, and lower operational complexity compared to wet scrubbing methods, though they may exhibit slightly lower removal efficiencies in some applications.

The global Dry Desulfurization System market size was estimated at USD 1084.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
