Abstracts

A dry diaphragm vacuum pump is a positive displacement vacuum pump that utilizes a flexible diaphragm, typically made of elastomeric or composite materials, actuated by a mechanical linkage to create suction and discharge cycles without the need for lubricating oils or working fluids in the pumping chamber. This design ensures a completely oil-free and contamination-free operation, making it suitable for applications where maintaining purity is critical, such as in laboratory environments, medical devices, pharmaceutical processing, and semiconductor manufacturing. By eliminating the risk of oil vapor backstreaming and reducing maintenance associated with fluid changes, dry diaphragm vacuum pumps offer a clean, reliable, and environmentally friendly alternative to traditional oil-sealed pumps, though they generally provide lower ultimate vacuum levels compared to other pump types.

The global Dry Diaphragm Vacuum Pump market size was estimated at USD 425.6 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
