Report Overview

An Dry Etch System shapes the thin film into a desired patterns using reaction gases (such as fluorocarbons, oxygen, chlorine, boron trichloride; sometimes with addition of nitrogen, argon, helium and other gases). There are three types of dry etching (e.g., plasma etching): chemical reactions (by using reactive plasma or gases), physical removal (generally by momentum transfer), and a combination of chemical reactions and physical removal. Common types of dry etching are reactive ion etching and deep reactive ion etching. The dry etching process typically etches directionally or anisotropically.
