Report Overview

Dry Etching Agent is a chemical agent used in semiconductor manufacturing and micro-nano processing, which is used to etch and etch the surface of materials in the absence of liquid media. Dry etching is a process of directly converting atoms or molecules on the surface of solid materials into gases or ions to achieve precise etching of materials and fabrication of micro-nano structures. Dry etching is usually performed under vacuum or controlled atmosphere conditions and uses dry etchant to accelerate and control the etching process. The choice of Dry Etching Agent depends on the desired etching material and specific processing requirements. Different dry etchants have different chemical compositions and reaction mechanisms, and are suitable for different materials and etching targets.
