Dry film lubricants are solid coatings applied to machinery components to reduce friction and wear. Unlike oils or greases, they form a dry, solid film that does not attract dust or debris. Common types include those based on PTFE, graphite, or molybdenum disulfide. They are essential in applications where liquid lubricants are impractical, such as in high-temperature, vacuum, or clean-room environments, significantly enhancing equipment longevity and performance in machinery manufacturing. The upstream sector involves raw material suppliers, primarily providing polymers (like PTFE), solid lubricants (e.g., graphite, MoS₂), and chemical solvents. Midstream comprises manufacturers who formulate and produce the final lubricant coatings. Downstream, the end-users are various machinery manufacturing sectors, including automotive, aerospace, and industrial equipment, which apply these coatings to components like bearings, gears, and slides.

The global Dry Film Lubricants for Machinery Manufacturing market size was estimated at USD 68.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.10% during the forecast period.
