Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Dry Gas Seal competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Dry gas seal is a non-contact shaft end sealing technology, mainly used in high-speed rotating equipment (such as compressors, pumps, etc.) to prevent gas leakage. Its core principle is to design a micron-level dynamic pressure groove structure on the sealing end face to form a stable gas film when the equipment is running, separate the dynamic ring from the static ring, and achieve contactless operation. This gas film can not only effectively prevent medium leakage, but also significantly reduce friction and wear, and extend the life of the seal. Dry gas seals usually use clean inert gas (such as nitrogen) as the sealing medium. It is suitable for sealing occasions with high pressure, high speed, volatile or toxic gases. It is an upgraded alternative to traditional lubricating mechanical seals.

The global Dry Gas Seal market size was estimated at USD 1977.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.10% during the forecast period.

This report offers a comprehensive and in-depth analysis of the global Dry Gas Seal market, covering all critical facets from a broad macroeconomic overview to detailed micro-level insights.
