Abstracts

Dry granulation machines are specialized pharmaceutical processing equipment used to convert fine powders into compact granules without the use of liquid binders, primarily through a two-step process involving compaction (via roller compactors) and subsequent milling to achieve the desired particle size distribution. This method is particularly advantageous for moisture-sensitive or heat-labile active pharmaceutical ingredients (APIs), as it avoids the drying phase required in wet granulation, thereby improving process efficiency, reducing energy consumption, and minimizing degradation risks. The machines are integral to tablet manufacturing lines, enabling better flow properties, uniform content uniformity, and controlled dissolution rates in final solid dosage forms, while also supporting continuous manufacturing paradigms and compliance with stringent regulatory standards such as Good Manufacturing Practice (GMP).

The global Dry Granulation Machines market size was estimated at USD 450.25 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.75% during the forecast period.
