Abstracts

Dry lubricating oil is a dry film lubricant prepared by mixing non-flammable fluorine solvent with perfluoropolyether oil and ultra-low molecular weight polytetrafluoroethylene (PTFE) particles, and adding additives such as heat resistance and corrosion resistance. After drying, this quick-drying lubricant forms a uniform lubricating film on the working surface, which has the characteristics of no dust, low torque, high and low temperature resistance, no oil splashing, and noise reduction, and solves the diffusion and pollution problems of traditional oily lubricants. The global chemical industry is part of the global economic development, and the cyclical economic development envelopes the global chemical industry. In recent years, global economic growth has slowed down, and the growth rate of the chemical industry has also gradually slowed down. The development of emerging economies such as China and India has continued to promote the global chemical industry to maintain a certain development trend in the past few years. In the future, these economies will continue to drive the chemical industry market forward with their large population base and strong domestic demand growth. In addition to the influence of the geopolitical characteristics of the Middle East, the shale gas industry in the United States among developed countries has become the biggest variable in recent years, driving the strong development of the U.S. chemical industry.

The global Dry Lube market size was estimated at USD 1814.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.40% during the forecast period.
