Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Dry Particle Ore Separator competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, the global production of Dry Particle Ore Separators is 3,133 units, with an average selling price of US\$150,000 per unit. A dry ore separator is a device designed for physical or photoelectric separation of ore particles in a waterless or low-humidity environment. It is suitable for ores with particle sizes typically ranging from 5mm to 100mm. This equipment uses magnetic, electrical, gravity, or sensor recognition technologies (such as XRT, LIBS, and visible light) to identify ore characteristics such as density, magnetism, conductivity, color, and elemental composition, thereby separating useful minerals from waste rock. Compared to wet separation, dry separation does not require water, making it suitable for mines in arid areas or with limited water resources. It also reduces tailings water treatment costs and improves environmental performance. Dry separators are widely used in metal, non-metallic, and rare earth ores, and are particularly valuable in green mine construction and the recycling of low-grade minerals.

The global Dry Particle Ore Separator market size was estimated at USD 470.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.30% during the forecast period.
