Abstracts

Inhalation capsules are a new and successful technique for directly delivering drugs to the respiratory system, providing a focused approach to treating a variety of respiratory disorders. These capsules, also known as dry powder inhalers (DPIs), have gained popularity in the field of respiratory medicine due to their ease of use, portability, and ability to provide immediate relief for people suffering from asthma, chronic obstructive pulmonary disease (COPD), and other respiratory conditions. One of the primary factors leading to inhalation capsules' adoption is their quick onset of action. Unlike oral drugs, which need to pass through the digestive system, inhalation permits the drug to be directly absorbed into the circulation via the respiratory system. This leads to faster therapeutic effects, making inhalation capsules especially useful in instances when a speedy reaction is required, such as emergency treatments or treating acute symptoms. Furthermore, inhalation capsules are ideal for elderly and pediatric patients since they avoid the difficulties associated with ingesting pills or tablets. Inhalation may be a more appealing and less threatening way for children to take medicines.

The global Dry Powder Inhalation Capsules market size was estimated at USD 891.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.40% during the forecast period.
