Abstracts

Dry reforming catalysts are specialized materials designed to facilitate the dry reforming of methane (DRM), a chemical process that converts methane (CH_4) and carbon dioxide (CO_2)—two potent greenhouse gases—into syngas, a mixture of hydrogen (H_2) and carbon monoxide (CO). These catalysts typically consist of active metals, such as nickel, cobalt, or noble metals like platinum and rhodium, supported on high-surface-area oxides like alumina, ceria, or zirconia, which enhance stability and prevent coking. The performance of these catalysts is critically evaluated based on their activity, selectivity toward syngas, resistance to deactivation (especially carbon deposition and sintering), and longevity under high-temperature reaction conditions. The development and optimization of dry reforming catalysts are driven by the dual objectives of mitigating greenhouse gas emissions and producing valuable syngas for downstream applications, including Fischer-Tropsch synthesis, methanol production, and fuel cells.

The global Dry Reforming Catalysts market size was estimated at USD 215.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.75% during the forecast period.
