Report Overview

Dry scrubbers are air pollution control devices that remove harmful gases and particulate matter from industrial exhaust streams using dry or semi-dry chemical reactions, unlike wet scrubbers that use liquid solutions. These systems typically employ sorbent materials such as lime, activated carbon, or sodium bicarbonate to neutralize acidic gases (SO₂, HCl, NO_x) through adsorption or chemical absorption. They are widely used in industries with high-temperature emissions, including power plants, cement production, waste incineration, and metal processing, as they offer advantages such as lower water consumption, reduced wastewater generation, and suitability for handling corrosive or high-dust-load gases. The technology is favored in regions with stringent emission regulations and water scarcity, with variations like spray dryer absorbers and circulating dry scrubbers catering to specific operational needs. Their efficiency, operational flexibility, and compliance with environmental standards drive adoption, though challenges like sorbent cost and residue disposal persist. The market is influenced by tightening global emission norms, industrial expansion in emerging economies, and advancements in sorbent materials and system design.

The global Dry Scrubbers market size was estimated at USD 1252.13 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.25% during the forecast period.
