## Abstracts

Dry type transformers are electrical devices that transfer electrical energy between circuits without the use of liquid cooling or insulation, relying instead on air or solid insulation materials such as epoxy resin or cast resin to dissipate heat and ensure operational safety. These transformers are designed to operate in environments where fire safety, environmental concerns, or space constraints make oil-filled transformers impractical, making them particularly suitable for indoor installations, commercial buildings, hospitals, data centers, and industrial facilities. Their construction eliminates the risk of oil leaks, reduces maintenance requirements, and enhances resistance to moisture and contaminants, while offering advantages such as compact design, high efficiency, and compliance with stringent safety and environmental regulations.

The global Dry Type Transformer Device market size was estimated at USD 4850.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
