Abstracts

A two-axis gyro-stabilized platform is a device used to maintain balance and stability, and is commonly used in aerospace, marine, vehicle, and photography fields. It achieves attitude control and stabilization by utilizing the gyroscopic effect. Gyro-stabilized platforms consist of two mutually perpendicular gyro axes, each with a gyro, usually a gyro or gyro compass. These tops rotate at high speeds and are able to resist external forces and disturbances by keeping the direction of the axis of rotation stable, thereby keeping the platform in balance. When an external force or disturbance acts on the gyro-stabilized platform, the gyro shaft will generate a moment, which will cause the gyro to rotate, so as to keep the attitude of the platform stable. By controlling the rotation speed and direction of the gyroscope, the gyro-stabilized platform can realize the control of the stability and attitude of the platform. Dual-axis gyro-stabilized platforms are widely used in various fields. In aerospace, it can be used to stabilize the attitude control of aircraft and improve the stability and accuracy of flight. In ships and vehicles, it can be used to reduce vibrations and improve ride comfort. In the field of photography and videography, it can be used to eliminate the shaking of handheld devices and obtain smoother shooting effects.

The global Dual Axis Gyro Stabilized Platform market size was estimated at USD 280.45 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.85% during the forecast period.
