Abstracts

A dual centrifugal chiller is a large-scale HVAC system that uses two independent centrifugal compressors to provide cooling, typically for commercial, industrial, or institutional applications such as office buildings, hospitals, data centers, or manufacturing facilities. This design improves energy efficiency, operational flexibility, and redundancy, as the system can continue cooling even if one compressor fails or requires maintenance. By leveraging centrifugal force to compress refrigerant, these chillers achieve high cooling capacities with relatively lower energy consumption compared to other chiller types, making them suitable for environments where reliability, scalability, and energy savings are critical.

The global Dual Centrifugal Chiller market size was estimated at USD 1020.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
