Abstracts

The double-chamber stop valve is a stop valve with two independent chambers. Through the interaction between the two chambers, the medium can be cut off and the flow control can be achieved. This valve usually has a more complex structure and higher sealing performance requirements, and is suitable for occasions where it is necessary to strictly prevent leakage and mixing of the medium. The working principle of the double-chamber stop valve mainly depends on the interaction between the two chambers. When the medium needs to be cut off, the valve of one of the chambers is closed to prevent the medium from continuing to flow; when the medium needs to flow, the valve of the corresponding chamber is opened to allow the medium to pass smoothly. This working principle enables the double-chamber stop valve to achieve precise control of the medium.

The global Dual Chamber Stop Valve market size was estimated at USD 327.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.70% during the forecast period.
