Report Overview

A dual element transducer is a type of ultrasonic transducer that contains two piezoelectric elements. These elements are usually arranged in a single housing, with one element emitting an ultrasonic pulse and the other receiving the echo. Dual element transducers are commonly used in non-destructive testing (NDT) applications. They are used to inspect the entire thickness of a material, as each element allows for a different angle of inspection. The first element generates a short ultrasonic pulse that is reflected by internal defects, and the second element receives the reflected pulse.
