Abstracts

A dual frequency echosounder is a specialized marine acoustic instrument that transmits and receives sound pulses at two distinct frequencies?typically a high frequency (e.g., 200 kHz) for high-resolution detection of small targets and detailed seabed mapping in shallower waters, and a low frequency (e.g., 38 kHz) for deeper penetration to survey subsurface layers, detect larger objects, or characterize seabed composition in deeper environments; this dual-band capability allows for more versatile and accurate data collection compared to single-frequency systems, making it indispensable for applications such as hydrographic surveying, fisheries research, habitat mapping, dredging operations, and underwater infrastructure inspection.

The global Dual Frequency Echosounder market size was estimated at USD 128.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.35% during the forecast period.
