Report Overview

Dual-frequency ground-penetrating radar is an electromagnetic technology that uses radio waves to detect the distribution of underground media, and scans invisible targets or underground interfaces to determine their internal structure or location. Ground penetrating radar has the characteristics of high resolution, non-destructive, easy operation, strong anti-interference ability, etc., and realizes integration from data acquisition to image processing. It has the advantages of real-time output of on-site profile record diagrams, and is suitable for various environmental conditions. As long as there is a sufficient difference in physical properties between the underground pipeline target and the surrounding medium, it can be found by ground-penetrating radar. The pipeline detection capability of ground penetrating radar makes up for the detection defects of pipeline detectors, so it is widely used in the detection of urban underground pipelines.
