Abstracts

A dual-frequency laser is a laser that can generate two lasers of different frequencies in a laser resonant cavity at the same time. Its working principle is to use two interacting light modes to generate a light signal with a fixed frequency difference. This fixed frequency difference is called the frequency interval of the dual-frequency laser. The frequency interval of the dual-frequency laser determines its spectral characteristics, and the frequency interval can be adjusted by changing the structure of the laser, the control circuit, the temperature and other factors.

The global Dual Frequency Laser market size was estimated at USD 438.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.40% during the forecast period.
