## Abstracts

Dual-mode surface acoustic wave filter (Surface Acoustic Wave Filter, SAW Filter) is a filter technology widely used in wireless communication and electronic devices. Dual-mode surface acoustic wave filter is a filter made by using the physical properties of surface acoustic waves propagating on piezoelectric crystal substrates. It uses the piezoelectric effect to convert electrical signals into surface acoustic wave signals by evaporating metal films on piezoelectric substrates (such as quartz, lithium niobate, etc.) and making interdigital electrodes. It then adjusts the electrode structure and the propagation path of the surface acoustic wave to achieve filtering and selection of signals of specific frequencies. When a signal voltage is applied to the transmitting transducer (input interdigital electrode), an electric field is formed between the electrodes, causing the piezoelectric material to vibrate mechanically (i.e., ultrasonic waves), which propagate along the crystal surface in the form of surface acoustic waves. At the receiving end, the receiving transducer (output interdigital electrode) converts the mechanical vibration into an electrical signal output. With the rapid development of wireless communication technology, especially the deployment of 5G networks and the popularization of Internet of Things (IoT) devices, the market demand for dual-mode surface acoustic wave filters has increased significantly. Dual-mode surface acoustic wave filters are mainly used in the field of wireless communication, including smartphones, tablets, IoT devices, etc. They play an important role in screening signals and filtering noise in these devices, and are an indispensable component of the RF front end. In addition, with the continuous upgrading of communication technology, dual-mode surface acoustic wave filters are gradually used in emerging fields such as small base stations, satellite communications, and automotive electronics. In summary, the dual-mode surface acoustic wave filter market is in a rapid development stage, and the market scale is constantly expanding. In the future, the dual-mode surface acoustic wave filter market is expected to usher in a

broader development space.

The global Dual Mode SAW Filter market size was estimated at USD 631.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.30% during the forecast period.
