Abstracts

A dual module microinverter is an advanced power conversion device designed specifically for photovoltaic systems, which converts the direct current (DC) generated by two solar panels into alternating current (AC) for grid injection or local consumption. Unlike traditional string inverters that manage multiple panels in series, this microinverter operates at the panel pair level, providing independent maximum power point tracking (MPPT) for each module to optimize energy harvest even under partial shading, soiling, or mismatch conditions. It enhances system reliability through redundancy?since the failure of one microinverter affects only two panels rather than an entire string?and often integrates monitoring capabilities for individual panel performance. By enabling module-level optimization and safety through rapid shutdown compliance, dual module microinverters represent a middle ground between single-module microinverters and string inverters, balancing cost, efficiency, and scalability for residential and small commercial solar installations.

The global Dual Module Microinverter market size was estimated at USD 1250.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 12.50% during the forecast period.
