Abstracts

The dual optical path transmission analysis measuring instrument is an instrument used to measure the transmittance and absorptivity of materials. It calculates the transmittance and absorption rate of the sample by dividing the light beam emitted by the light source into two optical paths, passing through the sample to be measured and the reference sample respectively, and then measuring the transmitted light intensity of the two optical paths. Dual optical path transmission analysis measuring instrument usually consists of a light source, a spectrometer, a sample chamber and a photodetector. The light beam emitted by the light source is divided into two optical paths through the spectrometer, one optical path passes through the sample to be measured, and the other optical path passes through the reference sample. After the light beams of the two optical paths pass through the sample, they are received by the photodetector and the transmitted light intensity is measured. By comparing the transmitted light intensities of the two optical paths, the transmittance and absorbance of the sample can be calculated.

The global Dual Optical Path Transmission Analysis Measuring Instrument market size was estimated at USD 185.5 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.75% during the forecast period.
