## Abstracts

The dual-phase lock-in amplifier is a synchronous correlation detector designed using the cross-correlation principle. It uses the cross-correlation characteristics of the reference signal and the measured signal to extract the measured signal with the same frequency and phase as the reference signal. This amplifier has the ability to detect weak signals under a strong noise background. It usually includes a preamplifier circuit, a bandpass filter circuit, a reference trigger circuit, a phase-locked loop, a phase shift circuit, an in-phase phase-sensitive detector, an orthogonal phase-sensitive detector, a low-pass filter, and a vector operation circuit. The dual-phase lock-in amplifier market has the potential for continued growth. North America and Europe are the main consumer regions of the lock-in amplifier market, with the United States, Canada, Germany, the United Kingdom, and France having larger market sizes.

The global Dual Phase Lock-in Amplifier market size was estimated at USD 323.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.40% during the forecast period.
