Abstracts

Dual polarization radar, often abbreviated as dual-pol radar, is an advanced meteorological and remote sensing technology that transmits and receives both horizontal and vertical electromagnetic wave pulses, enabling it to gather detailed information about the size, shape, orientation, and phase of precipitation particles and other atmospheric targets. By analyzing the differential reflectivity, specific differential phase, correlation coefficient, and linear depolarization ratio, dual-pol radar provides significantly enhanced data accuracy compared to conventional single-polarization radar, allowing for improved discrimination between rain, snow, hail, and non-meteorological echoes such as birds or debris, which supports more precise weather forecasting, hydrological modeling, and severe weather warnings.

The global Dual Polarization Radar market size was estimated at USD 520.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
